

RemitBot.ai

Agent-to-Agent Payment Control Framework

Version 1.0 | October 5, 2026

<https://www.stratedgeworkflow.com/research/specifications/remitbot-payment-control>

This specification describes StratEdge's own product and control model. It is not an industry standard, a certification, or a customer result.

The checks RemitBot places on a payment started by an agent before value is allowed to move.

Purpose

RemitBot.ai is the control layer for agent-to-agent payments. A payment started by software should be approved, limited, and traceable.

This framework is StratEdge's product model, version 2026-10-05. It does not claim a bank charter, custody of funds, or a named rail partnership.

Checks

Before value moves, RemitBot can check the requesting agent's identity and authority, the stated intent, and the spending limit. The disposition is recorded.

Boundary

RemitBot is not the system that settles the payment. The public demonstration uses illustrative payment scenarios, not customer data.

How to cite this specification
